

## Cabinet Dryers

Cabinet dryers are mostly used for simultaneous drying of different kinds of polymers in small quantities or for drying materials for trial moulding. They are also found applications in electronics, electric machinery, electroplating, pharmacy, paint baking, printing industries, etc. for preheating or drying related products.

### Features:

- Accurate P.I.D. temperature control to achieve an even drying effect.
- Air-proofed insulating door can maintain temperature constantly inside as to reduce energy consumption.
- Stainless steel tray and liner bring no contamination to materials.
- Optimizing design for ease of maintenance and servicing.
- Designed flexible and adjustable air inlet and exhaust.
- Overheat protector can prevent excessive drying.
- Motor overload relay.
- Ampere meter and main switch installed on control panel.
- 24 hours timer, easy to operate.
- Visible alarm to indicate emerging troubles.
- Tray size and inner dimensions of the dryer can be specified according to requirements.

## Outline Drawing

## Working Principle Illustration

## Working Principle

For cabinet dryers, materials to be dried are placed on the stainless steel moveable material trays. During operation, process air will flow to heating coil and be heated up to required temperature, then flow through a manifold with evenly scattered holes. Moisture air is sent out through air exhaust port. Designed to achieve a uniform drying effect.

1. Heating coil
2. Blower air inlet
3. Air chamber
4. Multi-vane impeller
5. Paint-baked cover
6. Air inlet
7. Air exhaust
8. Stainless steel tray
9. Heat-resistant layer
